Exploration  
Reach an island  
No-lost zone

# Our problem

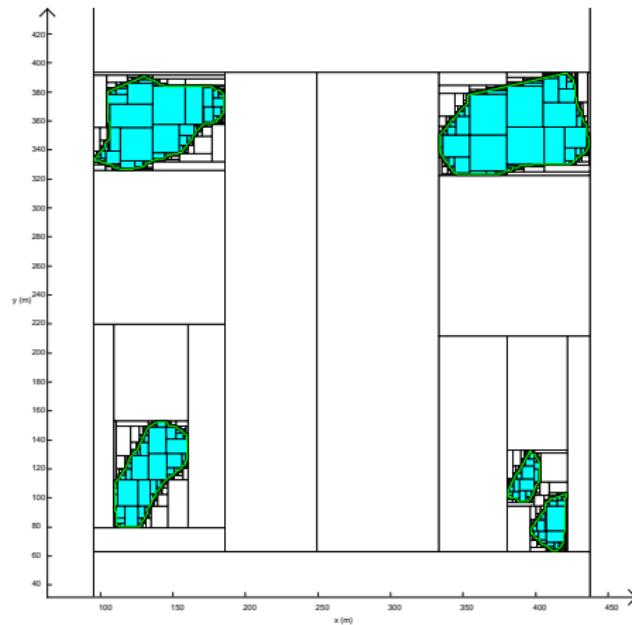

- Given a set of geo-localized islands  $\mathbf{m}_i, i \geq 0$ .
- The  $i$ th coastal area is:

$$\mathbb{C}_i = \{\mathbf{x} \mid c_i(\mathbf{x}) \leq 0\}.$$

- A robot has to move in this environment without being lost.

Reach an island  
No-lost zone

# Blind observer

Given

$$\begin{cases} \dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u}), & \mathbf{u}(t) \in [\mathbf{u}](t) \\ \mathbf{y} = \mathbf{g}(\mathbf{x}), & \mathbf{y}(t) \in [\mathbf{y}](t) \\ \mathbf{x}(0) = \mathbf{x}_0 & \end{cases}$$

An observer is *blind* if  $\dim \mathbf{y} = 0$ .

# Predict is a blind estimation problem

$$\begin{cases} \dot{\mathbf{x}}(t) &= \mathbf{f}(\mathbf{x}(t), \mathbf{u}(t)) \\ \mathbf{y}(t) &= \mathbf{g}(\mathbf{x}(t)) + \mathbf{e}_y(t) & \mathbf{e}_y(t) \in [\mathbf{e}_y] \\ \mathbf{u}(t) &= \mathbf{r}(\mathbf{y}(t)) + \mathbf{e}_u(t) & \mathbf{e}_u(t) \in [\mathbf{e}_u] \end{cases}$$

$$\left\{ \begin{array}{l} \dot{\mathbf{x}}(t) = \mathbf{f}(\mathbf{x}(t), \mathbf{r}(\mathbf{g}(\mathbf{x}(t)) + \mathbf{e}_y(t)) + \mathbf{e}_u(t)) \\ \mathbf{e}_y(t) \in [\mathbf{e}_y], \mathbf{e}_u(t) \in [\mathbf{e}_u] \end{array} \right.$$

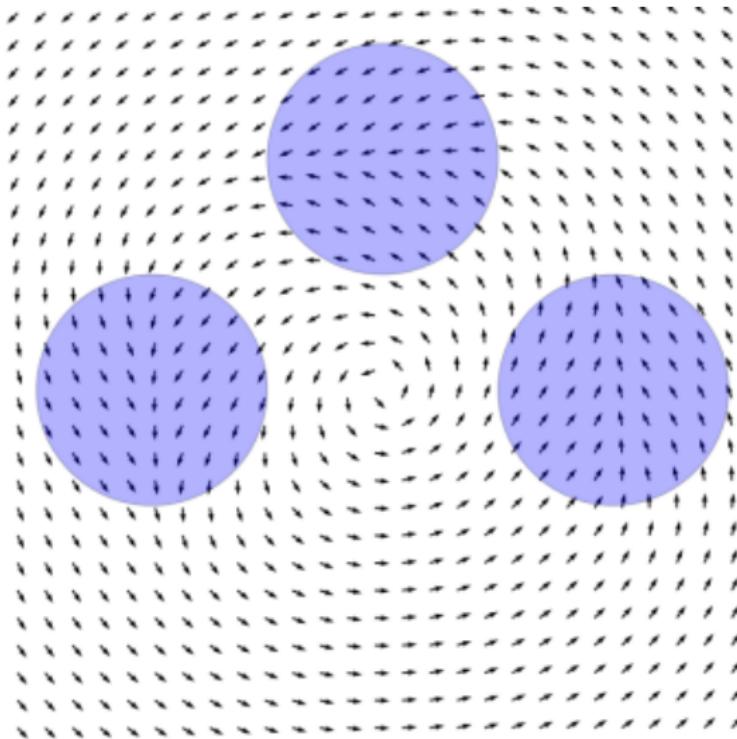

$$\begin{aligned}\dot{\mathbf{x}}(t) &= \mathbf{h}(\mathbf{x}(t), \mathbf{v}(t)) \\ \mathbf{v}(t) &\in [\mathbf{v}]\end{aligned}$$

with

$$\mathbf{v} = (\mathbf{e}_y, \mathbf{e}_u)$$

$$\mathbf{h}(\mathbf{x}, \mathbf{v}) = \mathbf{f}(\mathbf{x}, \mathbf{r}(\mathbf{g}(\mathbf{x}) + \mathbf{e}_y) + \mathbf{e}_u)$$

$$[\mathbf{v}] = [\mathbf{e}_y] \times [\mathbf{e}_u]$$

# Polynesian navigation

## Exploration

### Reach an island

### No-lost zone

## Visible area

The robot has a state  $x$ . The visible area is  $\mathbb{V}(x)$

**Example.** The robot is able to see all up to 3 meters

$$\mathbb{V}(x) = \left\{ (z_1, z_2) \mid (z_1 - x_1)^2 + (z_2 - x_2)^2 \leq 9 \right\}.$$

## Blind exploration

The explored zone  $\mathbb{Z}$  is defined by [1]

$$\begin{cases} \dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u}), \quad \mathbf{u}(t) \in [\mathbf{u}](t) \\ \mathbb{Z} = \bigcup_{t \geq 0} \mathbb{V}(\mathbf{x}(t)) \\ \mathbf{x}(0) = \mathbf{x}_0 \end{cases}$$

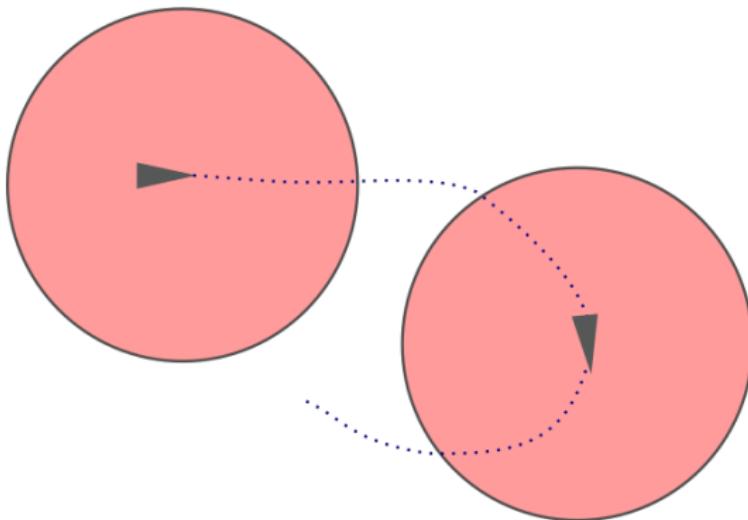

We have

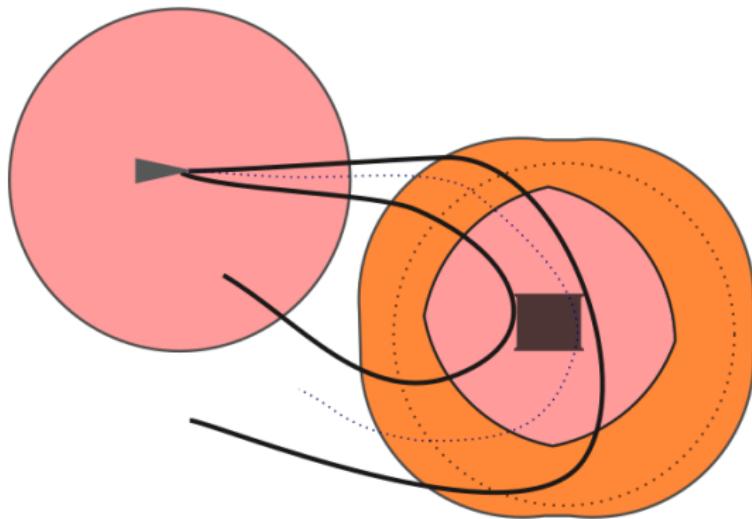

$$\underbrace{\bigcap_{\mathbf{x}(\cdot) \in \mathcal{X}(\cdot)} \bigcup_{t \geq 0} \mathbb{V}(\mathbf{x}(t))}_{\mathbb{Z}^-} \subset \mathbb{Z} \subset \underbrace{\bigcup_{\mathbf{x}(\cdot) \in \mathcal{X}(\cdot)} \bigcup_{t \geq 0} \mathbb{V}(\mathbf{x}(t))}_{\mathbb{Z}^+}.$$

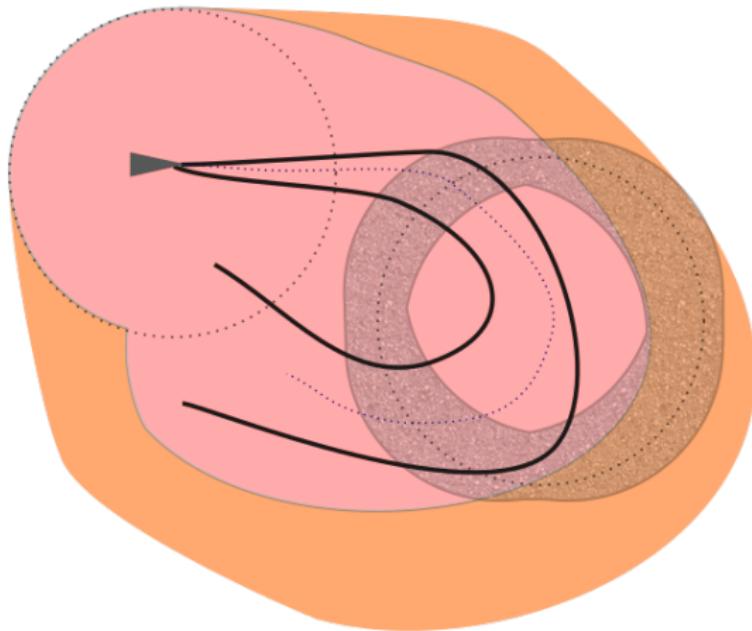

$\mathbb{Z}^-$  is the *certainly explored zone*.

$\mathbb{Z}^+$  is the *maybe explored zone*.

$\mathbb{Z}^+ \setminus \mathbb{Z}^-$  is the *penumbra*.

Daurade DGA-TN

During its boustrophedon Daurade explored  $\mathbb{Z} \in [[\mathbb{Z}]]$

Polynesian navigation  
Exploration  
Reach an island  
No-lost zone

# Reach an island

# Assumptions

- The coastal areas are small compare to the offshore area.
- In the coastal area, the robot knows its state
- Offshore, the robot is blind

Polynesian navigation  
Exploration  
**Reach an island**  
No-lost zone

# Robot

The robot is described by

$$\begin{cases} \dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u}), & \mathbf{u}(\cdot) \in [\mathbf{u}](t) \\ \mathbf{x}(0) = \mathbf{x}_0 \end{cases}$$

Offshore, the robot is blind and an open loop strategy.

The set flow  $\Phi : \mathbb{R} \times \mathbb{R}^n \rightarrow \mathcal{P}(\mathbb{R})$  is defined as:

$$\Phi(t_1, \mathbf{x}_0) = \{\mathbf{x}(t_1) | \exists \mathbf{u}(\cdot) \in [\mathbf{u}](t), \dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u}), \mathbf{x}(0) = \mathbf{x}_0\}$$

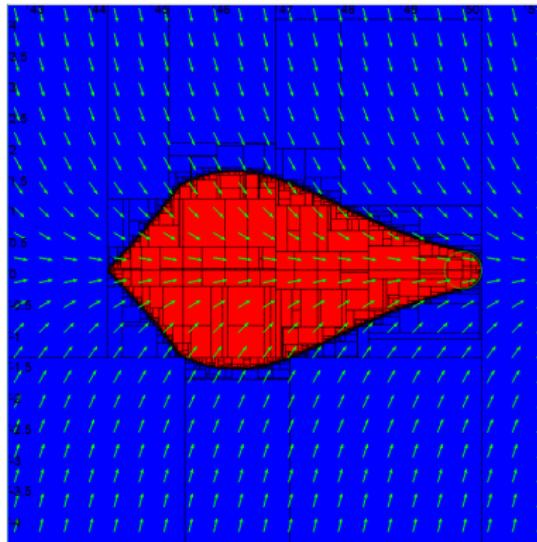

## Backward reach set

Given the set  $\mathbb{A}$ , the backward reach set is defined by

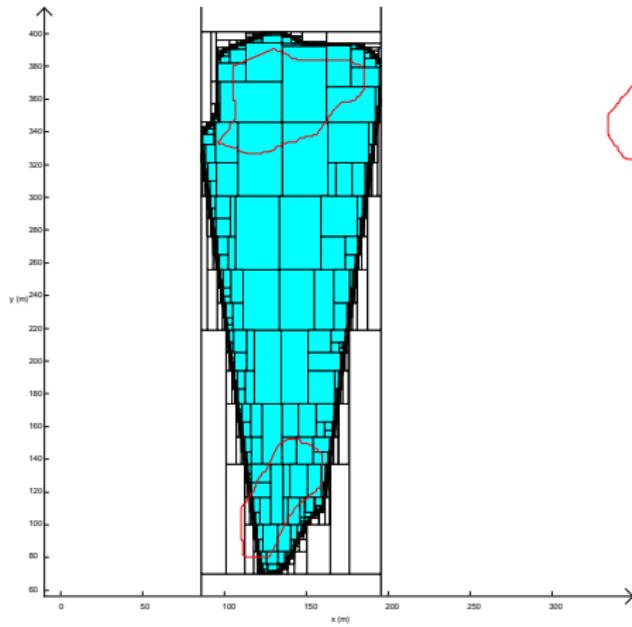

$$\text{Back}(\mathbb{A}) = \{\mathbf{x} \mid \forall \varphi \in \Phi, \exists t \geq 0, \varphi(t, \mathbf{x}) \in \mathbb{A}\}.$$

## Example.

$$\Phi(t, \mathbf{x}) = \begin{pmatrix} x_1 + t \\ e^{-t} \cdot x_2 \end{pmatrix} + t(1 + |x_2|) \begin{pmatrix} [-1, 1] \\ [-1, 1] \end{pmatrix}$$

Safe start points with a East strategy to reach the circle

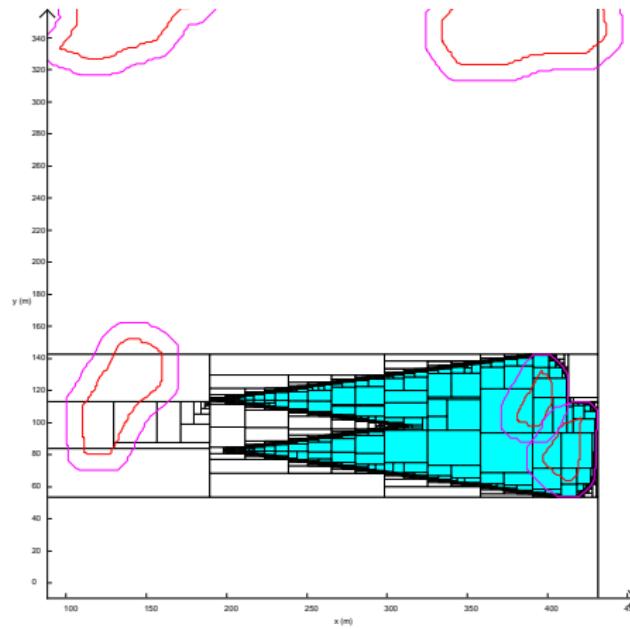

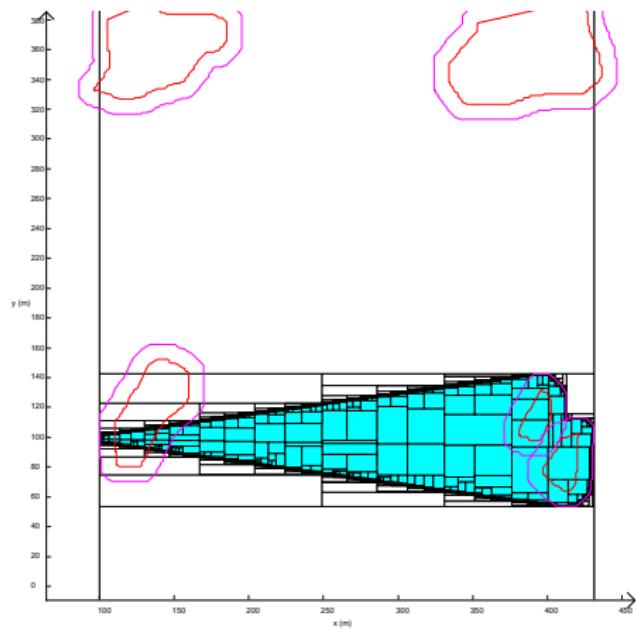

Polynesian navigation

No-lost zone

# Archipelagic effect

We have

$$\text{Back}(\mathbb{A} \cup \mathbb{B}) \supset \text{Back}(\mathbb{A}) \cup \text{Back}(\mathbb{B})$$

Polynesian navigation  
Exploration  
Reach an island  
**No-lost zone**

# No-lost zone

## Moving between coastal zones

- We have  $m$  coastal sets  $\mathbb{C}_1, \mathbb{C}_2, \dots, i \in \{1, 2, \dots\}$
- We have open loop control strategies  $\mathbf{u}_j, j \in \{1, 2, \dots\}$ ,
- Equivalently, we have set flows  $\Phi_j(t, \mathbf{x}_0)$ .
- The control strategy cannot change offshore.

Polynesian navigation  
Exploration  
Reach an island  
**No-lost zone**

# Graph

From  $\mathbb{C}_1$  we can reach  $\mathbb{C}_2$  with the  $j$ th control strategy if

$$\mathbb{C}_1 \cap \text{Back}(j, \mathbb{C}_2) \neq \emptyset.$$

From  $\mathbb{C}_1$  we can reach  $\mathbb{C}_2$  with at least one control strategy if

$$\mathbb{C}_1 \cap \bigcup_j \text{Back}(j, \mathbb{C}_2) \neq \emptyset.$$

From  $\mathbb{C}_1$  we can reach  $\mathbb{C}_2 \cup \mathbb{C}_3$  with at least one control strategy if

$$\mathbb{C}_1 \cap \bigcup_j \text{Back}(j, \mathbb{C}_2 \cup \mathbb{C}_3) \neq \emptyset.$$

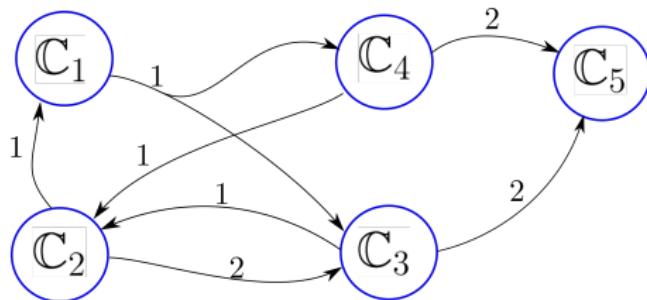

We define  $\hookrightarrow$  as:

- $C_a \hookrightarrow C_b$  if from  $C_a$  we can reach  $C_b$  with at least one control strategy  $j$ .
- $\hookrightarrow$  is the smallest transitive relation such that

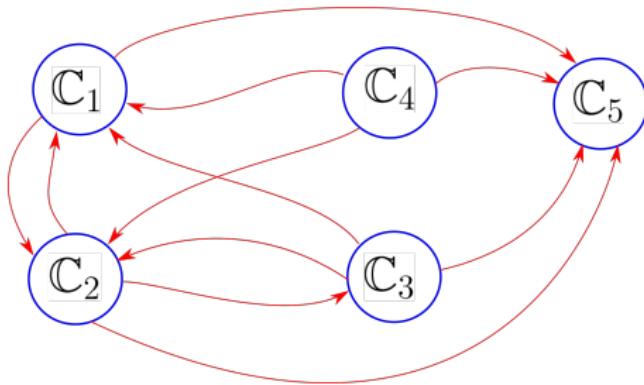

$$\left\{ \begin{array}{l} \forall k \in \mathbb{K}, C_{i_k} \hookrightarrow C_b \\ \exists j, C_a \cap \text{Back}(j, \bigcup_{k \in \mathbb{K}} C_{i_k}) \neq \emptyset \end{array} \right. \Rightarrow C_a \hookrightarrow C_b$$

Polynesian navigation  
Exploration  
Reach an island  
**No-lost zone**

# Graph

$$\mathbb{C}_1 \cap \text{Back}(1, \mathbb{C}_3 \cup \mathbb{C}_4) \neq \emptyset \Rightarrow \mathbb{C}_1 \rightarrow (\mathbb{C}_3, \mathbb{C}_4)$$

Graph of  $\hookrightarrow$

Polynesian navigation  
Exploration  
Reach an island  
**No-lost zone**

# Cycle

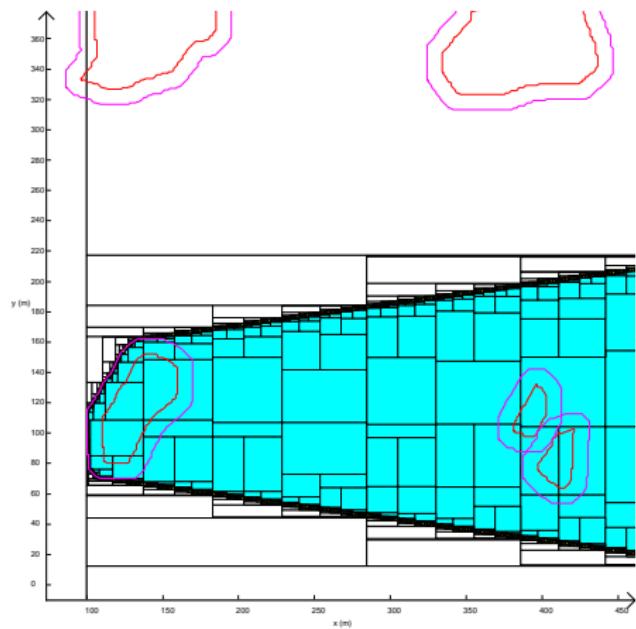

If

$$\left\{ \begin{array}{l} \mathbb{C}_{i_1} \cap \mathbb{C}_{i_2} = \emptyset \\ \mathbb{C}_{i_1} \hookrightarrow \mathbb{C}_{i_2} \\ \mathbb{C}_{i_2} \hookrightarrow \mathbb{C}_{i_1} \end{array} \right.$$

then we can revisit  $\mathbb{C}_{i_1}$  and  $\mathbb{C}_{i_2}$  for ever.

Forward

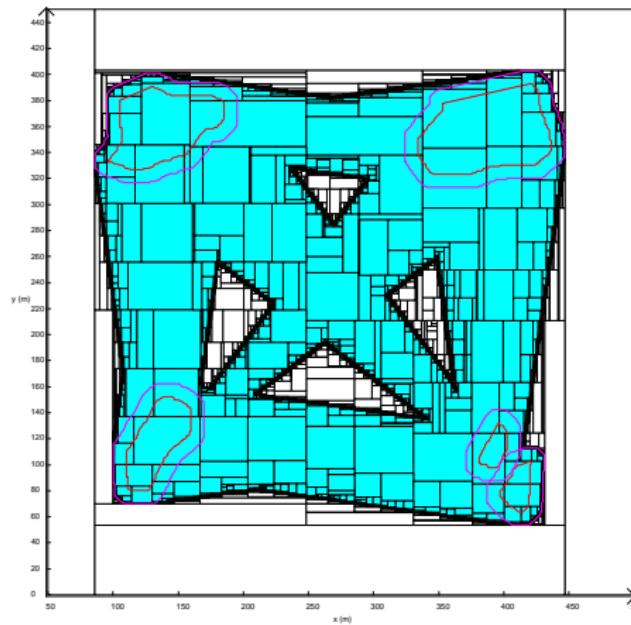

Polynesian navigation  
Exploration  
Reach an island  
No-lost zone

## No lost zone

It is the set of all points I can visit from a coastal area without being lost with the available control strategies.

It is a thick set.

## Open question

The robot at position **a** is lost for all feasible control strategies the robot cannot guarantee that it will reach an island.  
How to prove that the robot is lost?
