# Interval robotics

Chapter 6: SLAM

Luc Jaulin, ENSTA-Bretagne, Brest, France http://www.ensta-bretagne.fr/jaulin/

## 1 Basic SLAM

$$\left\{ egin{array}{lll} \dot{\mathbf{x}} &=& \mathbf{f}(\mathbf{x},\mathbf{u}) & (\ \mathbf{y} &=& \mathbf{g}(\mathbf{x},\mathbf{u}) & (\ \mathbf{z}_i &=& \mathbf{h}(\mathbf{x},\mathbf{u},\mathbf{m}_i) \end{array} 
ight.$$

(evolution equation) (observation equation) (mark equation)

#### *Redermor*, GESMA (Groupe d'Etude Sous-Marine de l'Atlantique)

## 1.1 Sensors

**GPS** (Global positioning system), only at the surface.

 $t_0 = 6000 \text{ s}, \quad \ell^0 = (-4.4582279^\circ, 48.2129206^\circ) \pm 2.5m$  $t_f = 12000 \text{ s}, \quad \ell^f = (-4.4546607^\circ, 48.2191297^\circ) \pm 2.5m$ 

### **Sonar** (KLEIN 5400 side scan sonar).

#### Screenshot of SonarPro

Mine detection with SonarPro

**Loch-Doppler** returns the speed robot  $\mathbf{v}_r$ .

$$\mathbf{v}_r \in \mathbf{ ilde{v}}_r + 0.004 * egin{bmatrix} -1,1 \end{bmatrix} . \mathbf{ ilde{v}}_r + 0.004 * egin{bmatrix} -1,1 \end{bmatrix}$$

Inertial central (Octans III from IXSEA).

$$\begin{pmatrix} \phi \\ \theta \\ \psi \end{pmatrix} \in \begin{pmatrix} \tilde{\phi} \\ \tilde{\theta} \\ \tilde{\psi} \end{pmatrix} + \begin{pmatrix} 1.75 \times 10^{-4} \cdot [-1,1] \\ 1.75 \times 10^{-4} \cdot [-1,1] \\ 5.27 \times 10^{-3} \cdot [-1,1] \end{pmatrix}$$

Six mines have been detected.

i	0	1	2	3	4	5
$\tau(i)$	7054	7092	7374	7748	9038	9688
$\sigma(i)$	1	2	1	0	1	5
$\tilde{r}(i)$	52.42	12.47	54.40	52.68	27.73	26.98

6	7	8	9	10	11
10024	10817	11172	11232	11279	11688
4	3	3	4	5	1
37.90	36.71	37.37	31.03	33.51	15.05

**Exercise**. Draw the association graph associated with the detections.

## 1.2 Constraints

$$t \in \{6000.0, 6000.1, 6000.2, \dots, 11999.4\},\$$

$$i \in \{0, 1, \dots, 11\},\$$

$$\begin{pmatrix} p_x(t) \\ p_y(t) \end{pmatrix} = 111120 \begin{pmatrix} 0 & 1 \\ \cos\left(\ell_y(t) * \frac{\pi}{180}\right) & 0 \end{pmatrix} \begin{pmatrix} \ell_x(t) - \ell_x^0 \\ \ell_y(t) - \ell_y^0 \end{pmatrix}$$

$$\mathbf{p}(t) = (p_x(t), p_y(t), p_z(t)),\$$

$$\mathbf{R}_{\psi}(t) = \begin{pmatrix} \cos\psi(t) & -\sin\psi(t) & 0 \\ \sin\psi(t) & \cos\psi(t) & 0 \\ 0 & 0 & 1 \end{pmatrix},\$$

$$\mathbf{R}_{\theta}(t) = \begin{pmatrix} \cos\theta(t) & 0 & \sin\theta(t) \\ 0 & 1 & 0 \\ -\sin\theta(t) & 0 & \cos\theta(t) \end{pmatrix},\$$

$$egin{aligned} \mathbf{R}_arphi(t) &= egin{pmatrix} 1 & 0 & 0 \ 0 & \cosarphi(t) & -\sinarphi(t) \ 0 & \sinarphi(t) & -\sinarphi(t) \ 0 & \sinarphi(t) & \cosarphi(t) \end{pmatrix}, \ \mathbf{R}(t) &= \mathbf{R}_\psi(t)\mathbf{R}_ heta(t)\mathbf{R}_arphi(t), \ \dot{\mathbf{p}}(t) &= \mathbf{R}(t).\mathbf{v}_r(t), \ ||\mathbf{m}(\sigma(i)) - \mathbf{p}( au(i))|| &= r(i), \ \mathbf{R}^\mathsf{T}( au(i)) \left(\mathbf{m}(\sigma(i)) - \mathbf{p}( au(i))\right) \in [0] imes [0,\infty]^{ imes 2}, \ m_z(\sigma(i)) - p_z( au(i)) - a( au(i)) \in [-0.5, 0.5] \end{aligned}$$

## 1.3 GESMI

# 2 Intervals in lattices

## 2.1 Lattices

A *lattice*  $(\mathcal{E}, \leq)$  is a partially ordered set, closed under least upper and greatest lower bounds.

The least upper bound of x and y is called the *join*:  $x \lor y$ .

The greatest lower bound is called the *meet*:  $x \wedge y$ .

The Cartesian product of two lattices  $(\mathcal{E}_1, \leq_1)$  and  $(\mathcal{E}_2, \leq_2)$  is a lattice  $(\mathcal{E}, \leq)$  with

 $(a_1, a_2) \leq (b_1, b_2) \Leftrightarrow ((a_1 \leq_1 b_1) \text{ and } (a_2 \leq_2 b_2)).$ 

**Exercise**.  $\mathcal{L} = ((\mathbb{B}, \mathbb{R}), \leq)$  is a lattice.

$$egin{array}{rll} ({
m false},5) ee ({
m true},2) &=& ? \ ({
m false},5) \wedge ({
m true},2) &=& ? \ op ({\cal L}) &=& ? \ op ({\cal L}) &=& ? \ op ({\cal L}) &=& ? \end{array}$$

**Example.** The set  $(\mathbb{R}^n, \leq)$  is a lattice with

$$\mathbf{x} \leq \mathbf{y} \Leftrightarrow \forall i \in \{1, \ldots, n\}, x_i \leq y_i.$$

#### Example.

The powerset  $\mathcal{P}(\mathbb{E})$  of all subsets of  $\mathbb{E}$  is a lattice with respect to the inclusion  $\subset$ .

What is the meet ? What is the join ?

#### Example

The set  ${\mathcal F}$  of all functions from  ${\mathbb R}$  to  ${\mathbb R}^n$  is a lattice with

$$\mathbf{f} \leq \mathbf{g} \Leftrightarrow \forall t \in \mathbb{R}, \ \mathbf{f}(t) \leq \mathbf{g}(t)$$

An interval of  $\mathcal{F}$  is called a *tube*.

**Intervals**. A *closed interval* (or *interval* for short) [x] of a lattice  $\mathcal{E}$  is a subset of  $\mathcal{E}$  which satisfies

$$[x] = \{x \in \mathcal{E} \mid \land [x] \le x \le \lor [x]\}.$$

The set  $\mathbb{I}\mathcal{L}$  of all intervals of a lattice  $\mathcal{L}$  is also a lattice with respect to  $\subset$ .

**Exercice**. Draw the Hasse diagram of the set of Boolean interval  $\mathbb{IB}$ .

#### Graph intervals

Both  $\emptyset$  and  $\mathcal{E}$  are intervals of  $\mathcal{E}$ .

**Exercise**. Contract the graph interval with respect to the constraint " $\mathcal{G}$  is an equivalence relation".

Interval in the lattice  $\left(\mathcal{P}\left(\mathbb{R}^{n}
ight),\subset
ight)$ 

An interval function (or tube) and a set interval

#### 2.2 Interval arithmetic

$$\begin{split} & [\mathbb{A}], [\mathbb{B}], \ [\mathbb{A}] \cap [\mathbb{B}], \ [\mathbb{A}] \cup [\mathbb{B}], \\ & [\mathbb{A}] \setminus [\mathbb{B}], \ ([\mathbb{A}] \cup [\mathbb{B}]) \setminus ([\mathbb{A}] \cap [\mathbb{B}]). \end{split}$$

Intersection.

$$\begin{split} [\mathbb{A}] \sqcap [\mathbb{B}] &= \{\mathbb{X}, \mathbb{X} \in [\mathbb{A}] \text{ and } \mathbb{X} \in [\mathbb{B}] \} \\ &= \left[ \mathbb{A}^- \cup \mathbb{B}^-, \mathbb{A}^+ \cap \mathbb{B}^+ \right]. \end{aligned}$$

### 2.3 Contractors in lattices

A CSP is composed of a set of variables  $\{x_1, \ldots, x_n\}$ , of constraints  $\{c_1, \ldots, c_m\}$  and of domains  $\{X_1, \ldots, X_n\}$ .

The domains  $\mathbb{X}_i$  should belong to a lattice  $(\mathcal{L}_i, \subset)$ .

For SLAM, the domains are

(i) intervals of  $\mathbb{R}^n$  to represent the location of the marks,

(ii) tubes to represent the unknown trajectory and

(iii) intervals of subsets of  $\mathbb{R}^n$  to represent the free space.

#### Example

$$\left\{\begin{array}{c} \mathbb{A} \subset \mathbb{B} \\ \mathbb{A} \in [\mathbb{A}], \mathbb{B} \in [\mathbb{B}]. \end{array}\right.$$

Since

$$\mathbb{A} \subset \mathbb{B} \Leftrightarrow \mathbb{A} = \mathbb{A} \cap \mathbb{B} \Leftrightarrow \mathbb{B} = \mathbb{A} \cup \mathbb{B}.$$

the optimal contractor is

$$\begin{cases} (i) & [\mathbb{A}] := [\mathbb{A}] \sqcap ([\mathbb{A}] \cap [\mathbb{B}]) \\ (ii) & [\mathbb{B}] := [\mathbb{B}] \sqcap ([\mathbb{A}] \cup [\mathbb{B}]) \end{cases}$$

#### Tarski theorem.

If  $(\mathcal{L}, \leq)$  is a lattice and  $f : \mathcal{L} \to \mathcal{L}$  is monotonic (i.e.,  $a \leq b \Rightarrow f(a) \leq f(b)$ ), then  $x_{k+1} = f(x_k)$ , converges to the greatest  $x_{\infty}$  such that

$$\begin{cases} x_{\infty} = f(x_{\infty}) & \text{(fixed point)} \\ x_{\infty} \le x_{0} \end{cases}$$

## 2.4 Propagation

Consider the following CSP

$$\begin{cases} (i) & \mathbb{X} \subset \mathbb{A} \\ (ii) & \mathbb{B} \subset \mathbb{X} \\ (iii) & \mathbb{X} \cap \mathbb{C} = \emptyset \\ (iv) & f(\mathbb{X}) = \mathbb{X}, \end{cases}$$

where  $\mathbb{X} \subset \mathbb{R}^2$ , f is a rotation of  $-\frac{\pi}{6}$ , and

$$\begin{cases} \mathbb{A} &= \left\{ (x_1, x_2), x_1^2 + x_2^2 \leq 3 \right\} \\ \mathbb{B} &= \left\{ (x_1, x_2), (x_1 - 0.5)^2 + x_2^2 \leq 0.3 \right\} \\ \mathbb{C} &= \left\{ (x_1, x_2), (x_1 - 1)^2 + (x_2 - 1)^2 \leq 0.15 \right\} \end{cases}$$

# 3 Range-only SLAM with occupancy maps

 $\begin{cases} \dot{\mathbf{x}}(t) = \mathbf{f}(\mathbf{x}(t), \mathbf{u}(t)) & (\text{evolution equation}) \\ z(t) = d(\mathbf{x}(t), \mathbb{M}) & (\text{map equation}) \end{cases}$ where  $t \in \mathbb{R}, \ \mathbf{x} \in \mathbb{R}^n, \ \mathbf{u} \in \mathbb{R}^m, \ \mathbb{M} \in \mathcal{C}(\mathbb{R}^q)$  is the occupancy map.

**Unknown**: the map  $\mathbb{M}$  and the trajectory  $\mathbf{x}$ .

Impact, covering and dug zones

#### Tescase

$$\begin{cases} \dot{x}_{1}(t) = u_{1}(t) \cos(u_{2}(t)) \\ \dot{x}_{2}(t) = u_{1}(t) \sin(u_{2}(t)) \\ z(t) = d(\mathbf{x}(t), \mathbb{M}). \end{cases}$$

Actual trajectory and dug space

Width of the tubes  $[\mathbf{x}](t)$ 

## 4 Range only SLAM with undistinguishable marks

$$\begin{cases} \mathbf{\dot{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u}) & (\text{evolution equation}) \\ (t_i, \mathcal{H}_i(\mathbf{x})) & (\text{sector list}) \end{cases}$$

**Example**. A robot is located at  $(x_1, x_2)$ . If at time  $t_3$  the robot detects one single mark at a distance  $d \in [4, 5]$ m,

 $\mathcal{H}_3(\mathbf{x}): \left\{ \mathbf{a} \in \mathbb{R}^2 | (x_1 - a_1)^2 + (x_2 - a_2)^2 \in [16, 25] \right\}.$ 

The robot has detected the mark inside the ring

**Theorem.** Consider a set of marks  $\mathcal{M} \subset \mathbb{R}^q$ . Define the free space as  $\mathbb{F} = \{\mathbf{p} \in \mathbb{R}^q \mid \mathbf{p} \notin \mathcal{M}\}$ . Consider msectors  $\mathbb{H}_1, \ldots, \mathbb{H}_m$ , each of them containing exactly one mark and define  $\mathbf{a}(i) = \mathcal{M} \cap \mathbb{H}_i$ . We have

(i) 
$$\mathbb{H}_i \subset \mathbb{H}_j \Rightarrow \mathbf{a}(i) = \mathbf{a}(j)$$
  
(ii)  $\mathbb{H}_i \cap \mathbb{H}_j = \emptyset \Rightarrow \mathbf{a}(i) \neq \mathbf{a}(j)$   
(iii)  $\mathbb{H}_i \subset \mathbb{H}_j \Rightarrow \mathbb{H}_j \setminus \mathbb{H}_i \subset \mathbb{F}.$ 

Each of the two black zones contains a single mark and that no mark exists in the hatched area.

(i) 
$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u})$$
  
(ii)  $\mathbb{H}_i = \mathcal{H}_i(\mathbf{x}(t_i))$   
(iii)  $\mathbf{a}(i) \in \mathbb{H}_i$   
(iv)  $\mathbf{a}(i) = \mathbf{a}(j) \Leftrightarrow g_{ij} = \mathbf{1}$   
(v)  $\mathbf{a}(i) \in \mathbb{H}_j \Leftrightarrow g_{ij} = \mathbf{1}$   
(vi)  $g_{ij} = \mathbf{1} \Rightarrow \mathbb{H}_j \setminus \mathbb{H}_i \subset \mathbb{F}$   
(vii)  $\mathbf{a}(i) \notin \mathbb{F}$ 

Contractor graph

### 4.1 Testcase

Free space  $\mathbb{F}$ .
