# 1 Interval analysis

**Problem.** Given  $f : \mathbb{R}^n \rightarrow \mathbb{R}$  and a box  $[\mathbf{x}] \subset \mathbb{R}^n$ , prove that

$$\forall \mathbf{x} \in [\mathbf{x}], f(\mathbf{x}) \geq 0.$$

Interval arithmetic can solve efficiently this problem.

**Example.** Is the function

$$f(\mathbf{x}) = x_1x_2 - (x_1 + x_2)\cos x_2 + \sin x_1 \cdot \sin x_2 + 2$$

always positive for  $x_1, x_2 \in [-1, 1]$  ?

## Interval arithmetic

$$\begin{aligned}[-1, 3] + [2, 5] &= [1, 8], \\[-1, 3] \cdot [2, 5] &= [-5, 15], \\ \text{abs}([-7, 1]) &= [0, 7]\end{aligned}$$

The interval extension of

$$f(x_1, x_2) = x_1 \cdot x_2 - (x_1 + x_2) \cdot \cos x_2 + \sin x_1 \cdot \sin x_2 + 2$$

is

$$[f]([x_1], [x_2]) = [x_1] \cdot [x_2] - ([x_1] + [x_2]) \cdot \cos [x_2] + \sin [x_1] \cdot \sin [x_2] + 2.$$

**Theorem** (Moore, 1970)

$$[f]([\mathbf{x}]) \subset \mathbb{R}^+ \Rightarrow \forall \mathbf{x} \in [\mathbf{x}], f(\mathbf{x}) \geq 0.$$

# 3 Vaimos

Collaboration ENSTA/IFREMER

Vaimos at the WRSC (ENSTA-IFREMER-Ecole Navale).

$$\left\{ \begin{array}{l}
\dot{x} = v \cos \theta + p_1 a \cos \psi \\
\dot{y} = v \sin \theta + p_1 a \sin \psi \\
\dot{\theta} = \omega \\
\dot{v} = \frac{f_s \sin \delta_s - f_r \sin u_1 - p_2 v^2}{p_9} \\
\dot{\omega} = \frac{f_s (p_6 - p_7 \cos \delta_s) - p_8 f_r \cos u_1 - p_3 \omega}{p_{10}} \\
f_s = p_4 a \sin (\theta - \psi + \delta_s) \\
f_r = p_5 v \sin u_1 \\
\sigma = \cos (\theta - \psi) + \cos (u_2) \\
\delta_s = \begin{cases} \pi - \theta + \psi & \text{si } \sigma \leq 0 \\ \text{sign} (\sin (\theta - \psi)) \cdot u_2 & \text{sinon.} \end{cases}
\end{array} \right.$$

The robot satisfies a state equation

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u}).$$

With the controller  $\mathbf{u} = \mathbf{g}(\mathbf{x})$ , the robot satisfies

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}).$$

With all uncertainties, the robot satisfies.

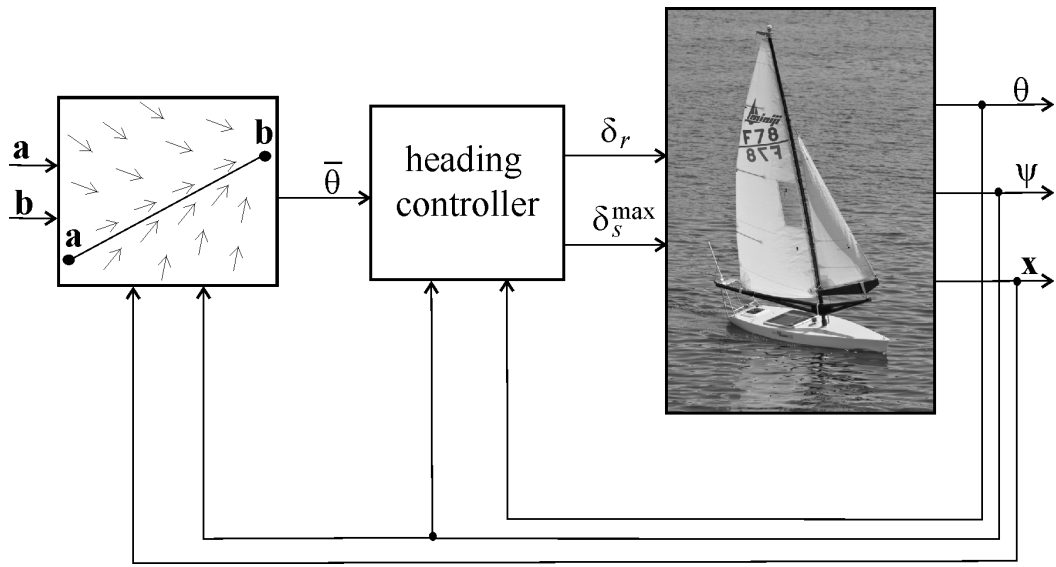

$$\dot{\mathbf{x}} \in \mathbf{F}(\mathbf{x})$$

which is a *differential inclusion*.

## 4 Line following

Controller of a sailboat robot

## Heading controller

$$\begin{cases} \delta_r &= \frac{\delta_r^{\max}}{\pi} \cdot \text{atan}\left(\tan \frac{\theta - \bar{\theta}}{2}\right) \\ \delta_s^{\max} &= \frac{\pi}{2} \cdot \left(\frac{\cos(\psi - \bar{\theta}) + 1}{2}\right). \end{cases}$$

# Rudder

$$\left\{ \delta_r = \frac{\delta_r^{\max}}{\pi} \cdot \text{atan}\left(\tan \frac{\theta - \bar{\theta}}{2}\right) \right.$$

# Sail

$$\delta_s^{\max} = \frac{\pi}{2} \cdot \left( \frac{\cos(\psi - \bar{\theta}) + 1}{2} \right)$$

## 4.1 Vector field

Nominal vector field:  $\theta^* = \varphi - \frac{1}{2} \cdot \text{atan}\left(\frac{e}{r}\right)$

A course  $\theta^*$  may be unfeasible

## 4.2 Controller

**Controlleur** : in:  $\mathbf{m}, \theta, \psi, \mathbf{a}, \mathbf{b}$ ; out:  $\delta_r, \delta_s^{\max}$ ; inout:  $q$

$$1 \quad e = \frac{\det(\mathbf{b}-\mathbf{a}, \mathbf{m}-\mathbf{a})}{\|\mathbf{b}-\mathbf{a}\|}$$

$$2 \quad \text{if } |e| > \frac{r}{2} \text{ then } q = \text{sign}(e)$$

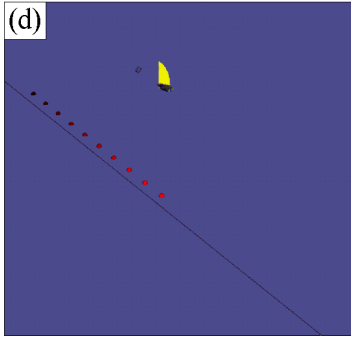

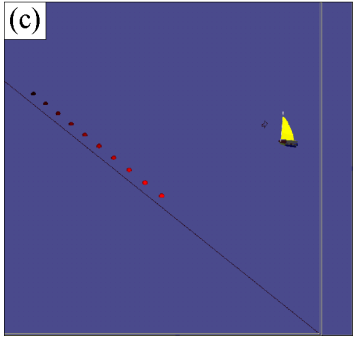

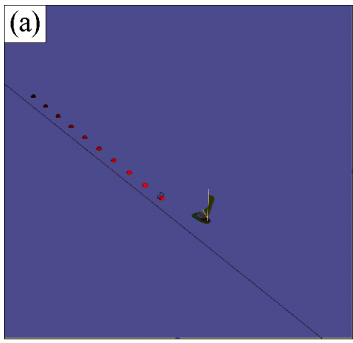

$$3 \quad \bar{\theta} = \text{atan2}(\mathbf{b} - \mathbf{a}) - \frac{1}{2} \cdot \text{atan}\left(\frac{e}{r}\right)$$

$$4 \quad \text{if } \cos(\psi - \bar{\theta}) + \cos \zeta < 0 \text{ then } \bar{\theta} = \pi + \psi - q \cdot \zeta.$$

$$5 \quad \delta_r = \frac{\delta_r^{\max}}{\pi} \cdot \text{atan}\left(\tan \frac{\theta - \bar{\theta}}{2}\right)$$

$$6 \quad \delta_s^{\max} = \frac{\pi}{2} \cdot \left( \frac{\cos(\psi - \bar{\theta}) + 1}{2} \right).$$

# 5 Validation by simulation

# 6 Theoretical validation

\*Jaulin, Le Bars (2012). An interval approach for stability analysis; Application to sailboat robotics. IEEE TRO.

When the wind is known, the sailboat with the heading controller is described by

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}).$$

The system

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x})$$

is Lyapunov-stable (1892) if there exists  $V(\mathbf{x}) \geq 0$  such that

$$\begin{aligned}\dot{V}(\mathbf{x}) &< 0 \text{ if } \mathbf{x} \neq \mathbf{0}, \\ V(\mathbf{x}) &= 0 \text{ iff } \mathbf{x} = \mathbf{0}.\end{aligned}$$

**Definition.** Consider a differentiable function  $V(\mathbf{x}) : \mathbb{R}^n \rightarrow \mathbb{R}$ . The system  $\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x})$  is  $V$ -stable if

$$\left( V(\mathbf{x}) \geq 0 \Rightarrow \dot{V}(\mathbf{x}) \leq \varepsilon < 0 \right).$$

**Theorem.** If the system  $\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x})$  is  $V$ -stable then

- (i)  $\forall \mathbf{x}(0), \exists t \geq 0$  such that  $V(\mathbf{x}(t)) < 0$
- (ii) if  $V(\mathbf{x}(t)) < 0$  then  $\forall \tau > 0, V(\mathbf{x}(t + \tau)) < 0$ .

Now,

$$\begin{aligned} & \left( V(\mathbf{x}) \geq 0 \Rightarrow \dot{V}(\mathbf{x}) < 0 \right) \\ \Leftrightarrow & \left( V(\mathbf{x}) \geq 0 \Rightarrow \frac{\partial V}{\partial \mathbf{x}}(\mathbf{x}) \cdot \mathbf{f}(\mathbf{x}) < 0 \right) \\ \Leftrightarrow & \forall \mathbf{x}, \frac{\partial V}{\partial \mathbf{x}}(\mathbf{x}) \cdot \mathbf{f}(\mathbf{x}) < 0 \text{ or } V(\mathbf{x}) < 0 \\ \Leftrightarrow & \max \left( \frac{\partial V}{\partial \mathbf{x}}(\mathbf{x}) \cdot \mathbf{f}(\mathbf{x}), V(\mathbf{x}) \right) < 0 \end{aligned}$$

**Theorem.** We have

$$\begin{cases} \frac{\partial V}{\partial \mathbf{x}}(\mathbf{x}) \cdot \mathbf{f}(\mathbf{x}) \geq 0 \\ V(\mathbf{x}) \geq 0 \end{cases} \text{ inconsistent} \Leftrightarrow \dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}) \text{ is } V\text{-stable.}$$

Interval method could easily prove the  $V$ -stability.

**Theorem.** We have

$$\left\{ \begin{array}{l} \frac{\partial V}{\partial \mathbf{x}}(\mathbf{x}) \cdot \mathbf{a} \geq 0 \\ \mathbf{F}^-(\mathbf{x}) \leq \mathbf{a} \leq \mathbf{F}^+(\mathbf{x}) \\ V(\mathbf{x}) \geq 0 \end{array} \right. \text{ inconsistent} \Leftrightarrow \dot{\mathbf{x}} \in \mathbf{F}(\mathbf{x}) \text{ is } V\text{-stable}$$

Differential inclusion  $\dot{\mathbf{x}} \in \mathbf{F}(\mathbf{x})$  for the sailboat.

$$V(\mathbf{x}) = x_2^2 - r_{\max}^2.$$

# 7 Experimental validation

Collaboration ENSTA-Ifremer. Fabrice Le Bars, Olivier Ménage, Patrick Rousseau, . . .

Rade de Brest

**Brest-Douarnenez.** January 17, 2012, 8am

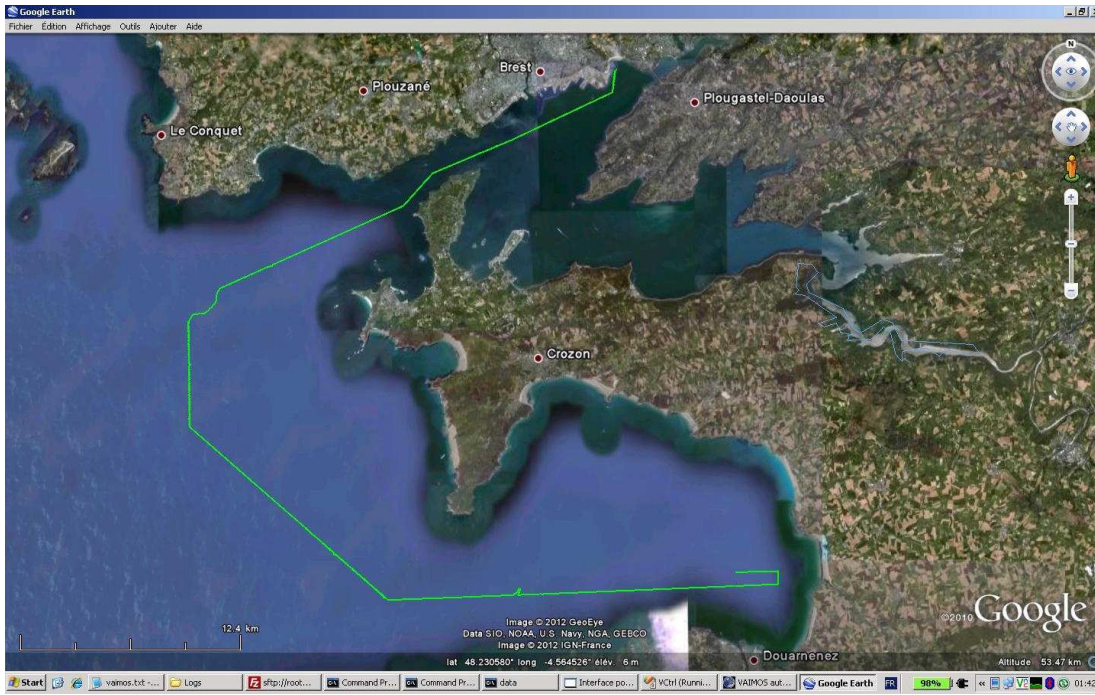

Middle of Atlantic ocean, 350 km made by Vaimos in  
53h, September 6-9, 2012.

## **Consequence.**

It is possible for a sailboat robot to navigate inside a corridor.

Essential, to create circulation rules when robot swarms are considered.

Essential to determine who has to pay in case of accident.
