## Lagrangian simulation

Guaranteed simulation of nonlinear continuous-time dynam

□ > 《注 > 《注 >

#### Contractors

◆□ > ◆□ > ◆豆 > ◆豆 > Guaranteed simulation of nonlinear continuous-time dynam

The operator  $\mathscr{C} : \mathbb{IR}^n \to \mathbb{IR}^n$  is a *contractor* [4] for the equation  $f(\mathbf{x}) = 0$ , if

$$\left\{ \begin{array}{ll} \mathscr{C}([\mathbf{x}]) \subset [\mathbf{x}] & (\text{contractance}) \\ \mathbf{x} \in [\mathbf{x}] \text{ and } f(\mathbf{x}) = 0 \Rightarrow \mathbf{x} \in \mathscr{C}([\mathbf{x}]) & (\text{consistence}) \end{array} \right.$$

→ < 프 > < 프 >

**Building contractors** Consider the primitive equation

$$x_1 + x_2 = x_3$$

with  $x_1 \in [x_1]$ ,  $x_2 \in [x_2]$ ,  $x_3 \in [x_3]$ .

< ∃ >

< ∃→

#### We have

$$\begin{array}{rcl} x_3 = x_1 + x_2 \Rightarrow & x_3 \in & [x_3] \cap ([x_1] + [x_2]) \\ x_1 = x_3 - x_2 \Rightarrow & x_1 \in & [x_1] \cap ([x_3] - [x_2]) \\ x_2 = x_3 - x_1 \Rightarrow & x_2 \in & [x_2] \cap ([x_3] - [x_1]) \end{array}$$

The contractor associated with  $x_1 + x_2 = x_3$  is thus

$$\mathscr{C}\left(\begin{array}{c} [x_1]\\ [x_2]\\ [x_3] \end{array}\right) = \left(\begin{array}{c} [x_1] \cap ([x_3] - [x_2])\\ [x_2] \cap ([x_3] - [x_1])\\ [x_3] \cap ([x_1] + [x_2]) \end{array}\right)$$

一回 ト イヨト イヨト

A trajectory is a function  $\mathbf{f}: \mathbb{R} \to \mathbb{R}^n$ . For instance

$$\mathbf{f}(t) = \left(\begin{array}{c} \cos t \\ \sin t \end{array}\right)$$

is a trajectory.

#### Order relation

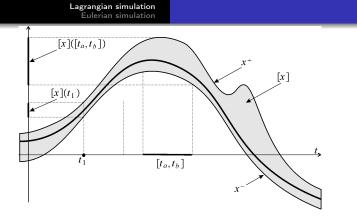

$$\mathbf{f} \leq \mathbf{g} \Leftrightarrow \forall t, \forall i, f_i(t) \leq g_i(t).$$

イロン イロン イヨン イヨン Guaranteed simulation of nonlinear continuous-time dynam

#### We have

$$\mathbf{h} = \mathbf{f} \quad \wedge \mathbf{g} \Leftrightarrow \forall t, \forall i, h_i(t) = \min(f_i(t), g_i(t)),$$

$$\mathbf{h} = \mathbf{f} \quad \forall \mathbf{g} \Leftrightarrow \forall t, \forall i, h_i(t) = \max(f_i(t), g_i(t)).$$

The set of trajectories is a lattice. Interval of trajectories (tubes) can be defined.

Example.

$$[\mathbf{f}](t) = \begin{pmatrix} \cos t + [0, t^2] \\ \sin t + [-1, 1] \end{pmatrix}$$

is an interval trajectory (or tube).

▶ < 문 > < E >

#### Tube arithmetics

Guaranteed simulation of nonlinear continuous-time dynam

P

→ < E → < E →</p>

If [x] and [y] are two scalar tubes [1], we have

$$\begin{aligned} &[z] = [x] + [y] \Rightarrow [z](t) = [x](t) + [y](t) & (sum) \\ &[z] = shift_a([x]) \Rightarrow [z](t) = [x](t+a) & (shift) \\ &[z] = [x] \circ [y] \Rightarrow [z](t) = [x]([y](t)) & (composition) \\ &[z] = \int [x] \Rightarrow [z](t) = \left[\int_0^t x^-(\tau) d\tau, \int_0^t x^+(\tau) d\tau\right] & (integral) \end{aligned}$$

□ ▶ ▲ 臣 ▶ ▲ 臣 ▶

#### Tube Contractors

Guaranteed simulation of nonlinear continuous-time dynam

▶ 《 문 ▶ 《 문 ▶

æ

P

Tube arithmetic allows us to build contractors [3].

・聞き ・ ヨキ・ ・ ヨキ

Consider for instance the differential constraint

$$egin{array}{rcl} \dot{x}(t) &=& x(t+1) \cdot u(t), \ x(t) &\in& [x](t), \dot{x}(t) \in [\dot{x}](t), u(t) \in [u](t) \end{array}$$

We decompose as follows

$$\begin{cases} x(t) = x(0) + \int_0^t y(\tau) d\tau \\ y(t) = a(t) \cdot u(t). \\ a(t) = x(t+1) \end{cases}$$

#### Example.

$$\begin{cases} \dot{x}_1 = x_3 \cos x_4 \\ \dot{x}_2 = x_3 \cos x_4 \\ \dot{x}_3 = u_1 \\ \dot{x}_4 = u_2 \\ (x_1 (5) - 1)^2 + (x_2 (5) - 2)^2 - 4 = 0 \\ (x_1 (7) - 1)^2 + (x_2 (7) - 2)^2 - 9 = 0 \end{cases}$$

With time-space constraints

$$\left\{ egin{array}{ll} \dot{\mathbf{x}}(t)&=&\mathbf{f}(\mathbf{x}(t),\mathbf{u}(t)) &t\in\mathbb{R}\ \mathbf{0}&=&\mathbf{g}(\mathbf{x}(t),\mathbf{x}(t'),t,t') &(t,t')\in\mathbb{T}\subset\mathbb{R} imes\mathbb{R}. \end{array} 
ight.$$

Example. An ultrasonic underwater robot with state

$$\mathbf{x} = (x_1, x_2, \dots) = (x, y, \theta, v, \dots)$$

At time t the robot emits an onmidirectional sound. At time t' it receives it

$$(x_1 - x_1^{'})^2 + (x_2 - x_2^{'})^2 - c(t - t^{'})^2 = 0.$$

## Mass spring problem

Guaranteed simulation of nonlinear continuous-time dynam

▶ 《 문 ▶ 《 문 ▶

The mass spring satisfies

$$\ddot{x} + \dot{x} + x - x^3 = 0$$

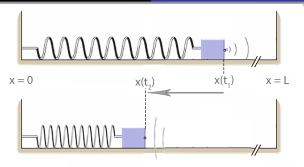

i.e.

$$\begin{cases} \dot{x}_1 = x_2 \\ \dot{x}_2 = -x_2 - x_1 + x_1^3 \end{cases}$$

The initial state is unknown.

Image: A Image: A

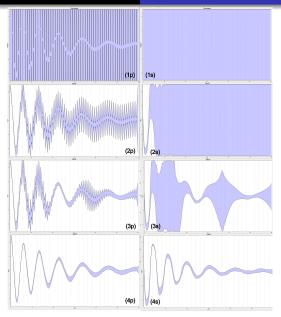

э

$$\begin{cases} \dot{x}_1 = x_2 \\ \dot{x}_2 = -x_2 - x_1 + x_1^3 \\ L - x_1(t_1) + L - x_1(t_2) = c(t_2 - t_1). \end{cases}$$

・ロト ・四ト ・ヨト ・ヨト Guaranteed simulation of nonlinear continuous-time dynam

Ξ.

#### ◆□ > ◆□ > ◆豆 > ◆豆 > Guaranteed simulation of nonlinear continuous-time dynam

Swarm localization

P

→ < E → < E →</p>

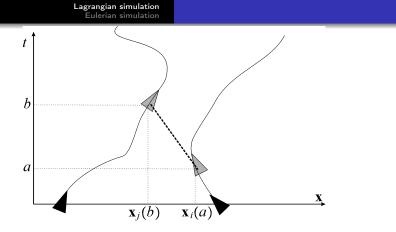

Consider *n* robots  $\mathscr{R}_1, \ldots, \mathscr{R}_n$  described by

 $\dot{\mathbf{x}}_i = \mathbf{f}(\mathbf{x}_i, \mathbf{u}_i), \mathbf{u}_i \in [\mathbf{u}_i].$ 

• = • • = •

Omnidirectional sounds are emitted and received.

A *ping* is a 4-uple (a, b, i, j) where *a* is the emission time, *b* is the reception time, *i* is the emitting robot and *j* the receiver.

With the time space constraint

$$\begin{aligned} \dot{\mathbf{x}}_i &= \mathbf{f}(\mathbf{x}_i, \mathbf{u}_i), \mathbf{u}_i \in [\mathbf{u}_i].\\ g\left(\mathbf{x}_{i(k)}\left(a(k)\right), \mathbf{x}_{j(k)}\left(b(k)\right), a(k), b(k)\right) = \mathbf{0} \end{aligned}$$

where

$$g(\mathbf{x}_i, \mathbf{x}_j, a, b) = ||x_1 - x_2|| - c(b - a).$$

▲□ ▶ ▲ □ ▶ ▲ □ ▶

Clocks are uncertain. We only have measurements  $\tilde{a}(k), \tilde{b}(k)$  of a(k), b(k) thanks to clocks  $h_i$ . Thus

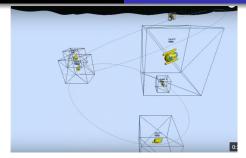

$$\begin{aligned} \dot{\mathbf{x}}_{i} &= \mathbf{f}(\mathbf{x}_{i}, \mathbf{u}_{i}), \mathbf{u}_{i} \in [\mathbf{u}_{i}].\\ g\left(\mathbf{x}_{i(k)}(a(k)), \mathbf{x}_{j(k)}(b(k)), a(k), b(k)\right) = 0\\ \tilde{a}(k) &= h_{i(k)}(a(k))\\ \tilde{b}(k) &= h_{j(k)}(b(k)) \end{aligned}$$

The drift of the clocks is bounded

$$\begin{split} \dot{\mathbf{x}}_{i} &= \mathbf{f}(\mathbf{x}_{i}, \mathbf{u}_{i}), \mathbf{u}_{i} \in [\mathbf{u}_{i}]. \\ g\left(\mathbf{x}_{i(k)}(a(k)), \mathbf{x}_{j(k)}(b(k)), a(k), b(k)\right) = 0 \\ \tilde{a}(k) &= h_{i(k)}(a(k)) \\ \tilde{b}(k) &= h_{j(k)}(b(k)) \\ \dot{h}_{i} &= 1 + n_{h}, \ n_{h} \in [n_{h}] \end{split}$$

## Eulerian simulation

Guaranteed simulation of nonlinear continuous-time dynam

→ < E → < E →</p>

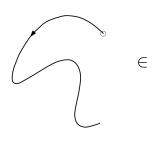

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・ Guaranteed simulation of nonlinear continuous-time dynam

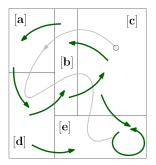

An *interval* is a *domain* which encloses a real number. A *polygon* is a *domain* which encloses a vector of  $\mathbb{R}^n$ . A *maze* is a *domain* which encloses a path. [6]

< ∃ > < ∃ >

A maze is a set of paths.

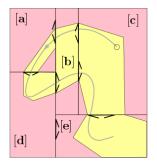

Guaranteed simulation of nonlinear continuous-time dynam

∃ → < ∃</p>

Mazes can be made more accurate:

Guaranteed simulation of nonlinear continuous-time dynam

< ∃→

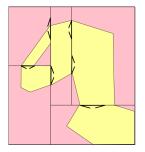

#### Here, a maze $\mathscr{L}$ is composed of [6][5].

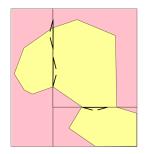

- A paving  ${\mathscr P}$
- Doors between adjacent boxes
