

# CSPs and Quantified CSPs

G. Verger

LIRMM - CNRS/University of Montpellier II, France

June 19th 2008 / SWIM 2008

- Consist of:

- A set of variables  $X = \{x_1, \dots, x_n\}$
- variables' domains (finite sets of possible values)
- A set of constraints  $C = \{c_1, \dots, c_k\}$

## Example

$$x \in \{1, 2\}, y \in \{1, 2\}, z \in \{1, 2\}, x = y, x \neq z, y > z$$

- Solutions of a CSP:

- Assignment of value from its domain to every variable satisfying all the constraints.

## Example

$(x, y, z) = (2, 2, 1)$  is a solution of above problem

## CSPs and Quantified CSPs

### CSP

Heuristics

### QCSP

Definition

Solving

Consistency

Heuristics

Techniques from SAT and QBF

Conclusion

- Characteristics
  - Exploring the search space
  - Complete and sound
  - Efficiency issues
- Two algorithms
  - Generate-and-Test (GT)
  - Backtracking(BT)

- Probably the most general problem solving method
- Algorithm :
  - 1 Instantiate all variables
  - 2 Test its satisfaction
  - 3 If not a solution, go back to 1
- Drawbacks :
  - Blind generator
- Possible improvements
  - Guiding the generator ( $\Rightarrow$  Local Search)
  - Checking consistency during generation ( $\Rightarrow$  BT)

- Incrementally extends a partial solution towards a complete solution.
- Algorithm :
  - 1 Instantiate a variable
  - 2 Check the consistency
  - 3 If there is a variable not instantiated, go to 1
- Drawbacks :
  - Trashing, redundant work
  - Late detection of inconsistencies
- Possible improvements
  - Loop-back methods
  - Look-ahead methods

- CSP as a graph :
  - Nodes are variables
  - Edges are constraints
- Aim : Removing inconsistent values from domains
- Different kinds of techniques :
  - Node Consistency (NC)
  - Arc Consistency (AC)
  - Path Consistency (PC)
  - k-consistency
- Not Complete

## CSPs and Quantified CSPs

### CSP

Solving

Consistency

**Propagation**

Heuristics

### QCSP

Definition

Solving

Consistency

Heuristics

Techniques from SAT and QBF

Conclusion

- Systematic search = not efficient
- Consistency checking = not complete
- $\Rightarrow$  Combine search and check!
- Two methods :
  - Look-ahead : prevent conflicts (FC, AC, SAC...)
  - Look-back : intelligent restoring after conflict (Backjumping, Dynamic BT)
- Current Solvers use BT + AC.

## CSPs and Quantified CSPs

### CSP

Definition  
Solving  
Consistency  
Propagation

### Heuristics

### Q CSP

Definition  
Solving  
Consistency  
Heuristics  
Techniques from SAT and QBF

### Conclusion

- CSP is NP-Complete
- Choices are made during BT
- $\Rightarrow$  are there better ways to explore the tree search?
- Two kinds of heuristics :
  - Variable Ordering Heuristics = Fail-First (MinDom, MaxDeg, Dom/Deg, Dom/wDeg)
  - Value Ordering Heuristics = Succeed-First (MinConflict, Geelen's Promise)
- Current Solvers use Dom/wDeg + MinConflict

## CSPs and Quantified CSPs

### CSP

Definition  
Solving  
Consistency  
Propagation  
Heuristics

### QCSP

Definition  
Solving  
Consistency  
Heuristics  
Techniques from SAT and QBF  
Conclusion

- Consists of:
  - A sequence of variables  $X = \{x_1, \dots, x_n\}$
  - variables' quantifiers (existential or universal)
  - variables' domains (finite sets of possible values)
  - A set of constraints  $C = \{c_1, \dots, c_k\}$

## Example

$$\exists x_1 \in \{1, 2, 3\} \forall y_1 \in \{1, 2\} \exists x_2 \in \{1, 2\} x_1 \neq x_2, y_1 = x_2$$

## Example

$$\exists x_1 \in \{1, 2, 3\} \forall y_1 \in \{1, 2\} \exists x_2 \in \{1, 2\} x_1 \neq x_2, y_1 = x_2$$

- A Scenario is :
  - an assignment of value from its domain to every variable satisfying all the constraints.
  - the solution of corresponding CSP

## Example

$(x_1, y_1, x_2) = (1, 2, 2)$  is a scenario of the previous QCSP

## Example

$$\exists x_1 \in \{1, 2, 3\} \forall y_1 \in \{1, 2\} \exists x_2 \in \{1, 2\} x_1 \neq x_2, y_1 = x_2$$

- A Strategy is :
  - the tree of winning scenarii corresponding to the QCSP

## Strategy

## CSPs and Quantified CSPs

### CSP

Definition  
Solving  
Consistency  
Propagation  
Heuristics

### QCSP

Definition  
**Solving**  
Consistency  
Heuristics  
Techniques from SAT and QBF  
Conclusion

- Transforming into CSP : exponential space!
- what techniques can we bring from classical CSP?
  - Backtracking?
  - Constraint Checking?
  - Heuristics?

## CSPs and Quantified CSPs

### CSP

Definition  
Solving  
Consistency  
Propagation  
Heuristics

### QCSP

Definition  
**Solving**  
Consistency  
Heuristics  
Techniques from SAT and QBF

### Conclusion

- Backtracking seems a reasonable start
- Algorithm :
  - Instantiate a variable
  - Check the consistency
  - If there is a variable not instantiated, go to 1
  - if all are instantiated, go to last unchecked universal variable

## CSPs and Quantified CSPs

### CSP

Definition  
Solving  
Consistency  
Propagation  
Heuristics

### QCSP

Definition  
**Solving**  
Consistency  
Heuristics  
Techniques from SAT and QBF

### Conclusion

- Backtracking seems a reasonable start
- Algorithm :
  - Instantiate a variable (**Order of variables!**)
  - Check the consistency
  - If there is a variable not instantiated, go to 1
  - if all are instantiated, go to last unchecked universal variable

## CSPs and Quantified CSPs

Definition  
Solving  
Consistency  
Propagation  
Heuristics

### QCSP

Definition  
**Solving**  
Consistency  
Heuristics  
Techniques from SAT and QBF  
Conclusion

- Backtracking seems a reasonable start
- Algorithm :
  - Instantiate a variable (**Order of variables!**)
  - Check the consistency (**Adapt Consistency techniques**)
  - If there is a variable not instantiated, go to 1
  - **if all are instantiated, go to last unchecked universal variable**

- As in CSP for existential variables
- for universal variables : removing one value = Fail

## The example of Quantified AC

$$x \in \{1, 2, 3\}, y \in \{1, 2\}$$

- $\exists x \exists y, x \neq y$  AC detects nothing
- $\forall x \exists y, x \neq y$  AC detects nothing
- $\forall x \forall y, x \neq y$  AC detects inconsistency!
- $\exists x \forall y, x \neq y$  AC removes 1 and 2 from  $x$ 's domain!

$\forall x \forall y$  and  $\exists x \forall y$  can be checked during preprocessing!

## CSPs and Quantified CSPs

### CSP

Heuristics

### QCSP

Definition

Solving

Consistency

Heuristics

Techniques from SAT and QBF

### Conclusion

- QCSP is PSPACE-Complete
- Choices are made during BT
- $\Rightarrow$  are there better ways to explore the tree search?
- Two kinds of heuristics :
  - Variable Ordering Heuristics
    - Fail-First (MinDom, MaxDeg, Dom/Deg, Dom/wDeg)  
**Inside a block!**
  - Value Ordering Heuristics
    - Succeed-First (MinConflict)  $\Rightarrow$  Existential variables
    - Fail-First (MaxConflict)  $\Rightarrow$  Universal variables

### Q CSP

Definition

Solving

Consistency

Heuristics

Techniques from SAT and QBF

Conclusion

Some techniques from boolean world.

- The Pure-Value Rule
  - From Pure-Literal in QBF
- Solution-Directed BackJumping
  - Cube learning in QBF

### Conclusion

- **Constraint Satisfaction Problem:**
  - Since 1974 (Montanari), 1977 (Mackworth)
  - Reference: Handbook of Constraint Programming (2006)
  - Solvers: ILOG Solver, JChoco, Minion. . .
  - Benchmarks: CSP-lib on the web
- **Quantified CSP:**
  - Since 2002 (Bordeaux, Monfroy)
  - No reference
  - Solvers: Qcsp-solve, QeCode, BlockSolve
  - No benchmarks!
